

TECH DEBTS TO BE DISCUSSED:

1. _basevalue may not be there is some docs in runtime , so it is not reliable check .

it is because federated validation can run at anywhere, not only during save, it can also run while changes gets merged to master branch in ALM or when miniapp is getting promoted

so save action versus miniapp promotion the document type will change

save will be a design time format

and also property may be overridden by LD's too in appbuild
