

SOR REACTOR:

If any change in entity alone (shape call r anything) in business event on UI , sor event is triggered.

1. When we receive a message or batch of messages in kinesis based on change in entity ,in sor.
2. Callback fun is called , It will process one message after other - process message mean - should update s3 data and mysql table for that data based on trigger type and operation to be performed.
3. Process message fun :
 1. forms a key using data from kinesis , and search for keys data in Redis and
 - 2.gets effectiveDate, subscriberTriggers data from Redis.
 - 3.Accordingly performs operations like db and S3Operation

Doubts:

UI side ? Y schema, be .. is deleting ? Try to run valid entity ..

For immediate trigger also should I need to update db (new coloums) -add sa, eff date

While uploading payload , should I need to update db (new coloums) - combining payload handles this ? - don't upload

System actor , mapping will come from kinesis data ? Done !

Y sor trigger endpoint ?

Excel sheet - ?
